

Counting Jar

Materials:

Empty jars/containers that are clear and easy to see through.

Various objects of different sizes to place inside the jars/containers.

Directions:

Using clear containers of equal size, fill them each with different size objects. Have children count the objects without touching them. Initially the number of objects in each jar should be small, as the children advance in their counting ability, add more objects (of smaller sizes). Children who are able to accomplish both tasks with ease can use the jars as an estimation jar, guessing how many objects the jar is holding.
